Slot Grid: 6 Classes × 17 Slots

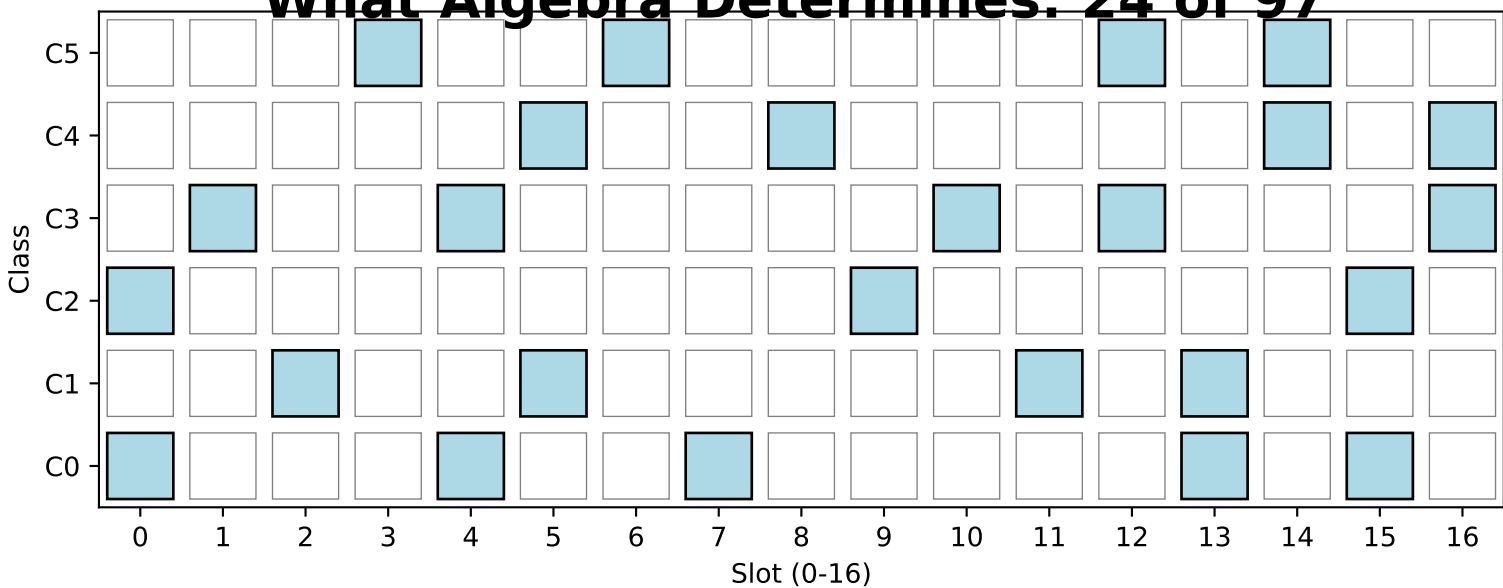

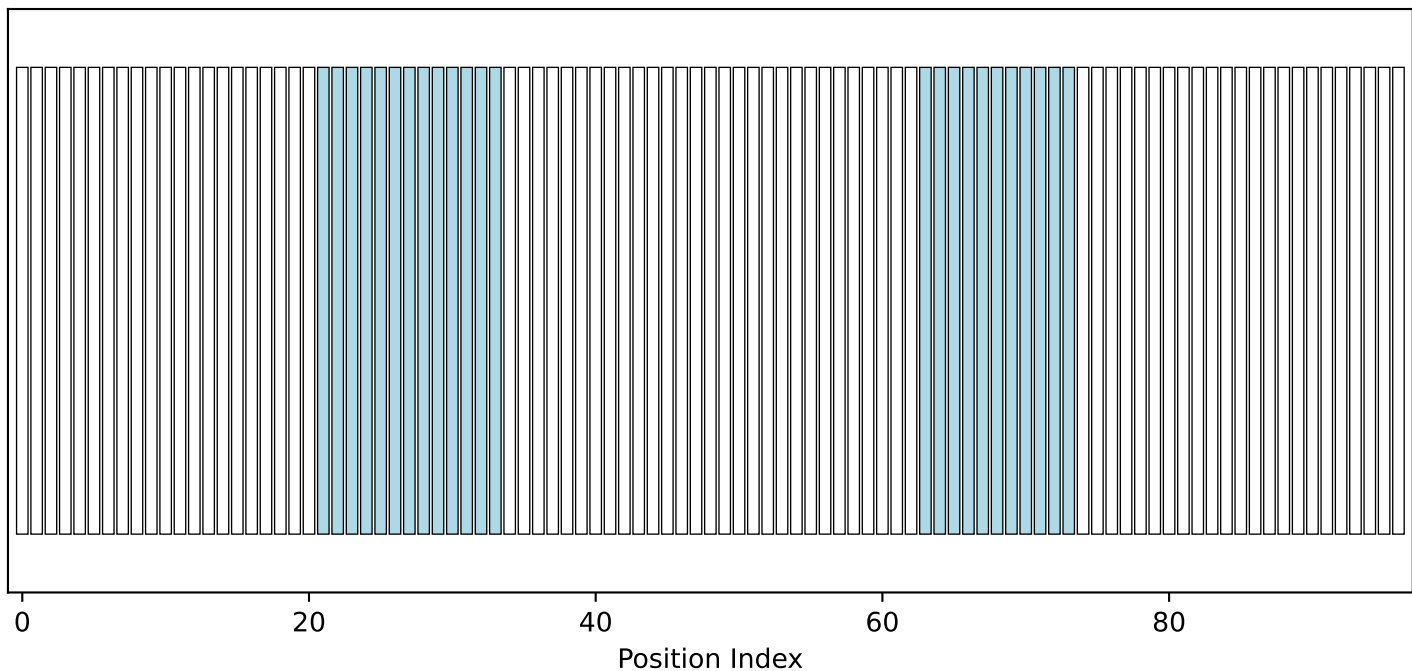

97 Plaintext Positions (Blue = Algebraically Determined)

Key Insight: The co-prime property (L=17 with 97 positions) ensures:

• Each slot appears at most once per class
• 4 anchor cribs force 24 unique slots
• These 24 slots map to exactly 24 plaintext positions
• The remaining 73 positions remain algebraically undetermined

With only algebra and the 4 anchors, we can determine exactly 24 of 97 positions.
No additional positions can be derived without more information.
